

IMPLEMENTING AN EVENT-DRIVEN APPROACH USING ACCESS

Laurence R. Paquette
Westfield State College

ABSTRACT

The objective of this paper is to provide the reader with some exposure as to how accounting information is recorded and processed when an event driven approach is implemented. The application described is from the sales/collection cycle and it should provide the information customer with a meaningful Access database exercise that will allow the user to implement the concepts set forth in good database design, as well as the event-driven approach to business technology solutions. The paper also serves as an exposure to the query tools provided by a relational database. The text of this article is excerpted in the form of a student exercise and is included as an Appendix, which can be used as an assignment by the AIS professor.
